... de Broglie wavelength, $\lambda = \frac{h}{p} = \frac{h}{\sqrt{2mE}}$

If a particle of mass m is in thermal equilibrium at a temperature T , then according to equipartition theorem, kinetic energy of the particle is given by

$$E = \frac{1}{2} kT$$

Scanned by CamScanner

Wave Mechanics 65

Since the particle has 3 degrees of freedom, $E = \frac{3}{2} kT$

where k = Boltzmann's constant

Therefore, the de Broglie wavelength associated with the particle is

26/4/2021 BZC-III CAM Cycle

https://upload.wikimedia.org/wiki/.../CAM_cycle_English.svg

The diagram illustrates the CAM cycle in two stages: night and day. At night, CO₂ enters the cell and is fixed by CA to form HCO₃⁻ + H⁺. This then reacts with PEP to form oxaloacetate, catalyzed by PEPCK. Oxaloacetate is converted to malate by MDH. Malate is then transported into the vacuole and stored. During the day, malate is released from the vacuole and converted back to malic acid by ME, which releases CO₂. This CO₂ enters the Calvin cycle (CC) where it is fixed to pyruvate by PEPCK. Pyruvate is then converted back to PEP by PPDK, which releases CO₂ for the Calvin cycle. The cycle is completed by the conversion of PEP to oxaloacetate by PEPCK, which then reacts with H⁺ to form malate, which is transported back to the vacuole.
